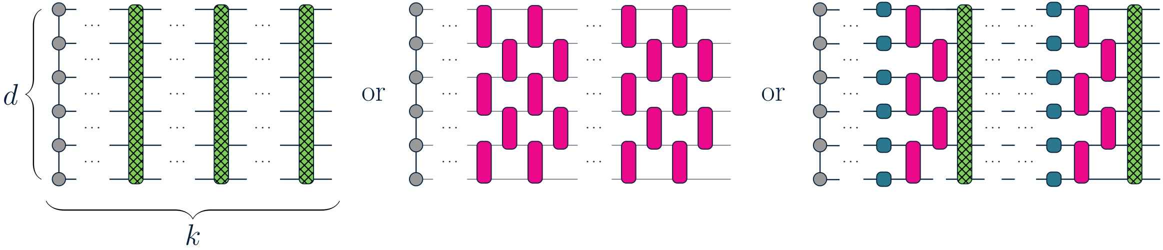
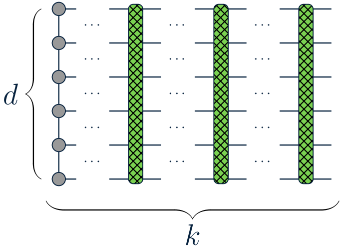
What Are (Random) Quantum Systems?

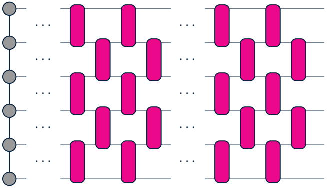


What *criteria* should we use when selecting an ansatz from an *ensemble*?

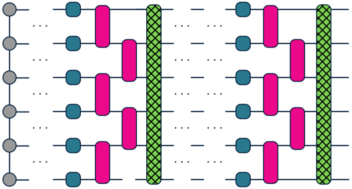
What Are (Random) Quantum Systems?



or

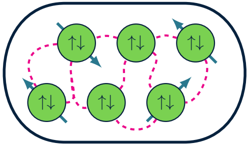


or

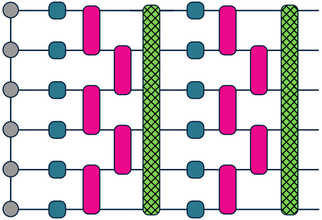


What if our ansatze are *noisy* or our dynamics are described by *quantum channels*?

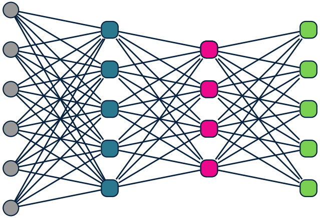
What Are (Random) Quantum Systems?



$\longleftrightarrow$



$\longleftrightarrow$



Quantum System

$$H = \sum_\mu \theta_\mu G_\mu$$

Quantum Circuit

$$\boxed{\Lambda = \prod_\mu \Lambda^\mu}$$

Classical Algorithm

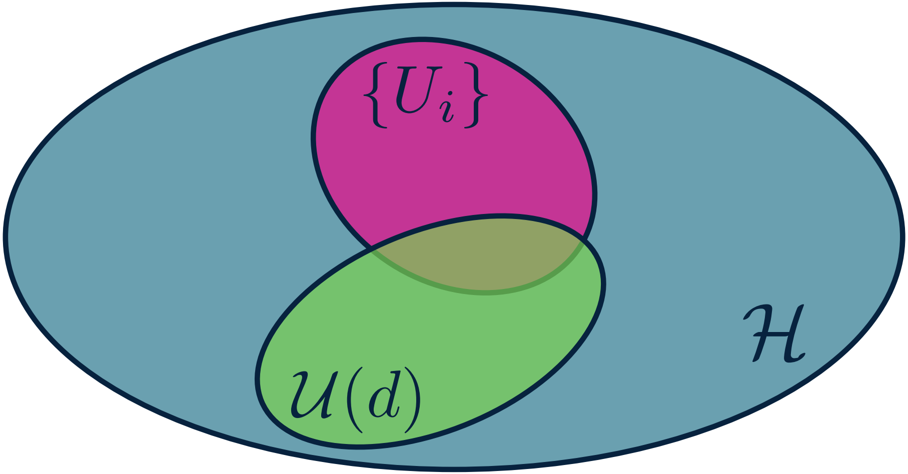
$$f = \circ_\mu f^\mu$$

What are Statistical Moments of Ensembles?

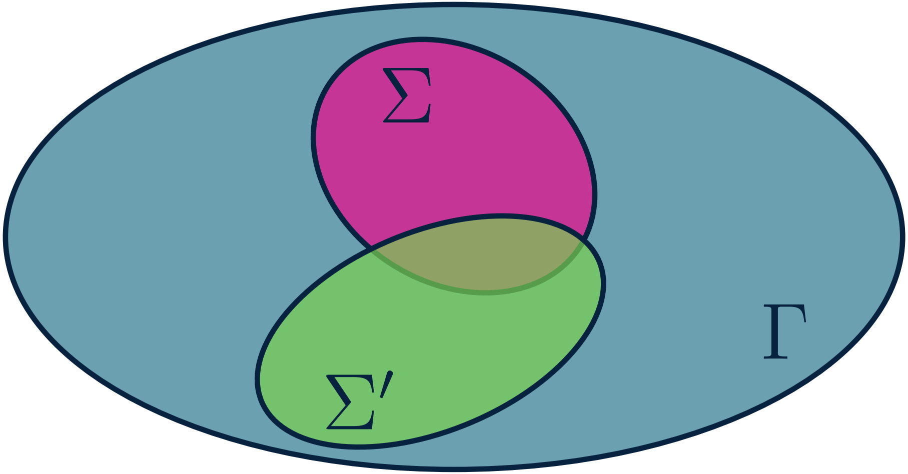
Suppose our channels $\Lambda \sim \Sigma$ are *randomly distributed*

What are the *statistical moments* of *random instances* of quantum systems?

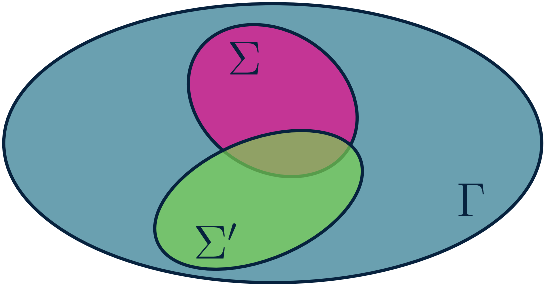
What are Statistical Moments of Ensembles?

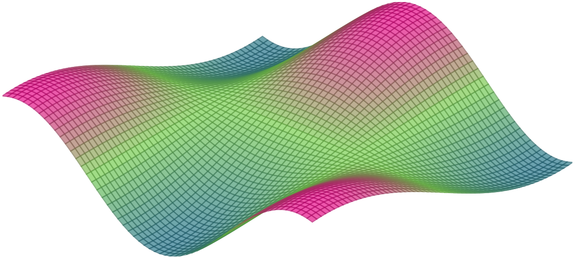


What are Statistical Moments of Ensembles?



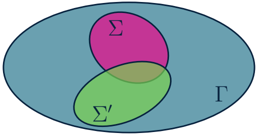
What are Statistical Moments of Ensembles?





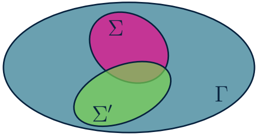
What are Statistical Moments of Ensembles?

- How may we *compare* ansatz via statistical *moments*?



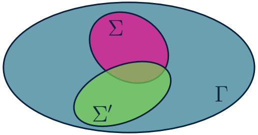
What are Statistical Moments of Ensembles?

- How may we *compare* ansatz via statistical *moments*?
- Do properties of statistics of ensembles relate to their *usefulness*?



What are Statistical Moments of Ensembles?

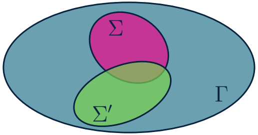
- How may we *compare* ansatz via statistical *moments*?
- Do properties of statistics of ensembles relate to their *usefulness*?
- Expressivity and trainability of *unitary ensembles* are well understood [1]



[1] Holmes, Z. *et al.*, *PRX Quantum* **3**, 010313 (2022)

What are Statistical Moments of Ensembles?

- How may we *compare* ansatz via statistical *moments*?
- Do properties of statistics of ensembles relate to their *usefulness*?
- Expressivity and trainability of *unitary ensembles* are well understood [1]
- How do moments of *quantum channel ensembles* depend on:
  - Noise induced phenomena
  - Underlying (parameterized) unitary evolution
  - Coupling with the environment



[1] Holmes, Z. *et al.*, *PRX Quantum* **3**, 010313 (2022)

Moment Operators

We are interested in computing t-order *moments* with respect to ensembles Σ,

$$\left\langle \left[\operatorname{tr}(\Lambda(\rho)O)\right]^t \right\rangle_{\Lambda\sim\Sigma} = \operatorname{tr}\left(\mathcal{T}_\Sigma^{(t)}(\rho^{\otimes t})O^{\otimes t}\right) = \langle\!\langle O^{\otimes t}|\widehat{\mathcal{T}}_\Sigma^{(t)}|\rho^{\otimes t}\rangle\!\rangle \tag{1}$$

via *twirls* or *moment operators*, with *vectorizations*,

$$\mathcal{T}_\Sigma^{(t)}(X) = \int_\Sigma d\Lambda\, \Lambda^{\otimes t}(X) \quad \rightarrow \quad \boxed{\mathcal{T}_\Sigma^{(t)}(X) \;\leftrightarrow\; \widehat{\mathcal{T}}_\Sigma^{(t)}|X\rangle\!\rangle} \tag{2}$$

Moment Operators

For example, channels Λ with Kraus operators $\{K_\Lambda\}$ may be represented as: Super-operators $\widehat{\Lambda}$, or Choi states Φ_Λ

$$\Lambda(X) = \sum_{K_\Lambda} K_\Lambda \; X \; K_\Lambda^\dagger \tag{3}$$

$$\leftrightarrow$$

$$\boxed{\widehat{\Lambda} = \sum_{K_\Lambda} K_\Lambda \otimes K_\Lambda^*} \quad , \quad \boxed{\Phi_\Lambda = (\Lambda \otimes I)(\Omega) = \sum_{K_\Lambda} |K_\Lambda\rangle\rangle\langle\langle K_\Lambda|} \tag{4}$$

$$X \to |X\rangle\rangle = X \otimes I \; |\Omega\rangle \; , \tag{5}$$

for un-normalized maximally entangled states Ω.

Moment Operators

For example, ensembles of *unitaries* $\mathcal{U}$ with a measure dU

$$\mathcal{T}_{\mathcal{U}}^{(t)}(X) = \int_{\mathcal{U}} dU \; U^{\otimes t} \; X \; U^{\otimes t \; \dagger} \qquad \rightarrow \qquad \widehat{\mathcal{T}}_{\mathcal{U}}^{(t)} = \int_{\mathcal{U}} dU \; U^{\otimes t} \otimes U^{\otimes t \; *} \tag{6}$$

Moment Operators

For example, ensembles of *channels* $\mathcal{C}$ with a measure $d\Lambda$

$$\mathcal{T}_{\mathcal{C}}^{(t)}(X) = \int_{\mathcal{C}} d\Lambda\ \Lambda^{\otimes t}(X) \qquad \rightarrow \qquad \widehat{\mathcal{T}}_{\mathcal{C}}^{(t)} = \int_{\mathcal{C}} d\Lambda\ \widehat{\Lambda^{\otimes t}} \tag{7}$$

Moment Operators

How do ensembles of *quantum channels* $\mathcal{C}$ differ from ensembles of *unitaries* $\mathcal{U}$?

t-Designs and Frame Potentials

- How may we *compare* ensembles via their moment operators?

t-Designs and Frame Potentials

- How may we *compare* ensembles via their moment operators?

- Ensembles Σ form *ϵ-t-designs* with respect to a *reference* ensemble Σ' if their t-order moment operators correspond with respect to a (i.e) Frobenius) *norm*

$$\|\widehat{\mathcal{T}}_{\Sigma}^{(t)} - \widehat{\mathcal{T}}_{\Sigma'}^{(t)}\|^2 \;=\; \epsilon \quad \rightarrow \quad 0 \tag{8}$$

t-Designs and Frame Potentials

- How may we *compare* ensembles via their moment operators?
- Ensembles Σ form *ϵ-t-designs* with respect to a *reference* ensemble Σ' if their t-order moment operators correspond with respect to a (i.e) Frobenius) *norm*

$$\|\widehat{\mathcal{T}}_{\Sigma}^{(t)} - \widehat{\mathcal{T}}_{\Sigma'}^{(t)}\|^2 = \boxed{\|\widehat{\mathcal{T}}_{\Sigma}^{(t)}\|^2} - \boxed{\|\widehat{\mathcal{T}}_{\Sigma'}^{(t)}\|^2} + \cdots \tag{9}$$

- How are t-designs related to norms of moment operators, or *frame potentials*?

t-Designs and Frame Potentials

- Super-operator norms and traces have *operational meaning*

i.e) Super-Operator Inner Products $\leftrightarrow$ Choi State Inner Products

For channels Λ, Γ:

$$\boxed{\left\langle \widehat{\Lambda}, \widehat{\Gamma} \right\rangle} = \mathrm{tr}\left(\widehat{\Lambda}^\dagger \widehat{\Gamma}\right) = \mathrm{tr}\left(\Phi_\Lambda \Phi_\Gamma\right) = \boxed{\left\langle \Phi_\Lambda, \Phi_\Gamma \right\rangle} \tag{10}$$

t-Designs and Frame Potentials

- Super-operator norms and traces have *operational meaning*

  i.e) Norm: Choi state purity , Trace: Entanglement fidelity

$$\boxed{\|\widehat{\Lambda}\|^2} = \mathrm{tr}\left(\Phi_\Lambda^2\right) \quad , \quad \boxed{\mathrm{tr}\left(\widehat{\Lambda}\right)} = \mathrm{tr}(\Omega\ \Phi_\Lambda) \tag{11}$$

t-Designs and Frame Potentials

- Super-operator norms and traces have *operational meaning*

  i.e) Norm: Choi state purity , Trace: Entanglement fidelity

$$\boxed{\|\widehat{\Lambda}\|^2} = \mathrm{tr}\left(\Phi_\Lambda^2\right) \quad , \quad \boxed{\mathrm{tr}\left(\widehat{\Lambda}\right)} = \mathrm{tr}(\Omega\ \Phi_\Lambda) \tag{11}$$

  - Unitary ensembles $\mathcal{U}$ consisting of strictly *unitaries* $\{U\}$

$$\boxed{\|\widehat{\mathcal{T}}_{\mathcal{U}}^{(t)}\|^2} = \int_{\mathcal{U}\times\mathcal{U}} dU\ dV\ |\langle\langle U|V\rangle\rangle|^{2t} \quad , \quad \boxed{\mathrm{tr}\left(\widehat{\mathcal{T}}_{\mathcal{U}}^{(t)}\right)} = \int_{\mathcal{U}} dU\ |\mathrm{tr}(U)|^{2t} \tag{12}$$

t-Designs and Frame Potentials

- Super-operator norms and traces have *operational meaning*

  i.e) Norm: Choi state purity , Trace: Entanglement fidelity

$$\boxed{\|\widehat{\Lambda}\|^2} = \mathrm{tr}\left(\Phi_\Lambda^2\right) \quad , \quad \boxed{\mathrm{tr}\left(\widehat{\Lambda}\right)} = \mathrm{tr}(\Omega\ \Phi_\Lambda) \tag{11}$$

- Unitary ensembles $\mathcal{U}$ consisting of strictly *unitaries* $\{U\}$

$$\boxed{\|\widehat{\mathcal{T}}_{\mathcal{U}}^{(t)}\|^2} = \int_{\mathcal{U}\times\mathcal{U}} dU\ dV\ |\langle\langle U|V\rangle\rangle|^{2t} \quad , \quad \boxed{\mathrm{tr}\left(\widehat{\mathcal{T}}_{\mathcal{U}}^{(t)}\right)} = \int_{\mathcal{U}} dU\ |\mathrm{tr}(U)|^{2t} \tag{12}$$

- Channel ensembles $\mathcal{C}$ consisting of *channels* with Kraus operators $\{\Lambda \leftrightarrow \{K_\Lambda\}\}$

$$\boxed{\|\widehat{\mathcal{T}}_{\mathcal{C}}^{(t)}\|^2} = \int_{\mathcal{C}\times\mathcal{C}} d\Lambda\ d\Gamma \sum_{K_\Lambda,K_\Gamma} |\langle\langle K_\Lambda|K_\Gamma\rangle\rangle|^{2t} \quad , \quad \boxed{\mathrm{tr}\left(\widehat{\mathcal{T}}_{\mathcal{C}}^{(t)}\right)} = \int_{\mathcal{C}} d\Lambda \sum_{K_\Lambda} |\mathrm{tr}(K_\Lambda)|^{2t} \tag{13}$$

Reference Ensembles

Channels present several choices for reference ensembles

Reference Ensembles

Channels present several choices for reference ensembles

- *Haar* ∼ Unitary Haar measure (uniformly random unitaries U) [1]

$$\boxed{\mathcal{T}^{(t)}_{\mathcal{U}(d)}(\rho)} = \int_{\mathcal{U}(d)} dU \; U^{\otimes t} \, \rho^{\otimes t} \, U^{\otimes t \, \dagger} \tag{14}$$

[1] Holmes, Z. *et al.*, *PRX Quantum* **3**, 010313 (2022)

Reference Ensembles

Channels present several choices for reference ensembles

- *Haar* ∼ Unitary Haar measure (uniformly random unitaries U)

$$\boxed{\mathcal{T}^{(t)}_{\mathcal{U}(d)}(\rho)} = \int_{\mathcal{U}(d)} dU \; U^{\otimes t} \; \rho^{\otimes t} \; U^{\otimes t \, \dagger} \tag{14}$$

- *cHaar* ∼ Stinespring Unitary Haar measure (random channels Λ) [2]

$$\boxed{\mathcal{T}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}(\rho)} = \mathrm{tr}_{\mathcal{E}}\left(\int_{\mathcal{U}(dd_{\mathcal{E}})} dU \; U^{\otimes t} \; \rho^{\otimes t} \otimes \; \nu_{\mathcal{E}}^{\otimes t} \; U^{\otimes t \, \dagger} \right) \tag{15}$$

[2] Kukulski, R. *et al.*, *J. Math. Phys.* **62**, 062201 (2021)

Reference Ensembles

Channels present several choices for reference ensembles

- *Haar* ∼ Unitary Haar measure (uniformly random unitaries U)

$$\boxed{\mathcal{T}^{(t)}_{\mathcal{U}(d)}(\rho)} = \int_{\mathcal{U}(d)} dU \; U^{\otimes t} \; \rho^{\otimes t} \; U^{\otimes t\,\dagger} \tag{14}$$

- *cHaar* ∼ Stinespring Unitary Haar measure (random channels Λ)

$$\boxed{\mathcal{T}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}(\rho)} = \mathrm{tr}_{\mathcal{E}}\left(\int_{\mathcal{U}(dd_{\mathcal{E}})} dU \; U^{\otimes t} \; \rho^{\otimes t} \otimes \; \nu_{\mathcal{E}}^{\otimes t} \; U^{\otimes t\,\dagger} \right) \tag{15}$$

- *Depolarizing* ∼ Maximally Depolarizing (single depolarizing channel $\mathcal{D}$) [3]

$$\boxed{\mathcal{T}^{(t)}_{\mathcal{D}(d)}(\rho)} = \frac{\mathrm{tr}\left(\rho^{\otimes t}\right)}{d^t} \; I^{\otimes t} \tag{16}$$

[3] Bai, J. *et al.*, *Quantum Information Processing* **23**, 1–18 (2024)

Computations with Invariant Ensembles

- *Invariant* ensembles (i.e) those corresponding with *group* structure $\mathcal{G}$) with *invariant measures* (i.e) Haar measures) have *projector* moment operators

$$\int_{\mathcal{G}} dU \; f(U \circ V) \; = \; \int_{\mathcal{G}} dU \; f(V \circ U) \; = \; \int_{\mathcal{G}} dU \; f(U) \qquad \forall \; V \in \mathcal{G} \tag{17}$$

$$\leftrightarrow$$

$$\boxed{\widehat{\mathcal{T}}_{\mathcal{G}}^{(t)} \; \widehat{\mathcal{T}}_{\mathcal{G}}^{(t)} \; = \; \widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}} \tag{18}$$

Computations with Invariant Ensembles

- Invariant ensemble moment operators *project* onto a set $\mathcal{S}_{\mathcal{G}}^{(t)}$ (the *commutant*)

$$\mathcal{T}_{\mathcal{G}}^{(t)}(X) \;=\; \frac{1}{d^t} \sum_{P \in \mathcal{S}_{\mathcal{G}}^{(t)}} \tau_{\mathcal{G}}^{(t)}(P, X)\; P \tag{19}$$

Computations with Invariant Ensembles

- Invariant ensemble moment operators *project* onto a set $\mathcal{S}_{\mathcal{G}}^{(t)}$ (the *commutant*)

$$U^{\otimes t} \;\; \mathcal{T}_{\mathcal{G}}^{(t)}(X) \;\; U^{\otimes t \; -1} \;=\; \mathcal{T}_{\mathcal{G}}^{(t)}(X) \qquad\qquad \forall\, U \in \mathcal{G}$$

$$\leftrightarrow$$

$$\boxed{\left[\mathcal{T}_{\mathcal{G}}^{(t)}(X)\;,\; U^{\otimes t}\right] = 0 \qquad\qquad \forall\, U \in \mathcal{G}} \tag{19}$$

$$\leftrightarrow$$

$$\left[P\;,\; U^{\otimes t}\right] = 0 \qquad\qquad \forall\, U \in \mathcal{G} \;\;,\;\; P \in \mathcal{S}_{\mathcal{G}}^{(t)}$$

Computations with Invariant Ensembles

- Subset-ensemble frame potentials are *lower bounded* by invariant frame potentials

$$\|\widehat{\mathcal{T}}_{\mathcal{H}}^{(t)} - \widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}\|^2 = \|\widehat{\mathcal{T}}_{\mathcal{H}}^{(t)}\|^2 - \|\widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}\|^2 \qquad \forall\, \mathcal{H} \subseteq \mathcal{G}$$

$$\leftrightarrow$$

$$\boxed{\|\widehat{\mathcal{T}}_{\mathcal{H}}^{(t)}\|^2 \geq \|\widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}\|^2 \qquad \forall\, \mathcal{H} \subseteq \mathcal{G}} \tag{20}$$

Computations with Invariant Ensembles

- Subset-ensemble frame potentials are *lower bounded* by invariant frame potentials

$$\|\widehat{\mathcal{T}}_{\mathcal{H}}^{(t)} - \widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}\|^2 = \|\widehat{\mathcal{T}}_{\mathcal{H}}^{(t)}\|^2 - \|\widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}\|^2 \qquad \forall\, \mathcal{H} \subseteq \mathcal{G}$$

$$\leftrightarrow$$

$$\boxed{\|\widehat{\mathcal{T}}_{\mathcal{H}}^{(t)}\|^2 \geq \|\widehat{\mathcal{T}}_{\mathcal{G}}^{(t)}\|^2 \qquad \forall\, \mathcal{H} \subseteq \mathcal{G}} \tag{20}$$

For example, subgroups of Haar distributed *unitaries* $\mathcal{U} \subseteq \mathcal{U}(d)$

$$\boxed{\|\widehat{\mathcal{T}}_{\mathcal{U}}^{(t)}\|^2 \geq \|\widehat{\mathcal{T}}_{\mathcal{U}(d)}^{(t)}\|^2 \quad \leftrightarrow \quad \mathcal{S}_{\mathcal{U}}^{(t)} \supseteq \mathcal{S}_{\mathcal{U}(d)}^{(t)}} \tag{21}$$

Computations with Invariant Ensembles

Do such *relationships* between moment operators and norms hold for ensembles of quantum channels $\mathcal{C} \supseteq \mathcal{U}$?

Computations with Invariant Ensembles

Do such *relationships* between moment operators and norms hold for ensembles of quantum channels $\mathcal{C} \supseteq \mathcal{U}$?

Issue: Ensembles of channels generally have less *structure* and are thus *non-invariant* and *non-projective*

i.e) Depolarization $\widehat{\mathcal{D}} \circ \widehat{\mathcal{T}}_{\mathcal{C}}^{(t)} \;=\; \widehat{\mathcal{D}} \;\neq\; \widehat{\mathcal{T}}_{\mathcal{C}}^{(t)} \circ \widehat{\mathcal{D}}$

i.e) Non-invariance under k *concatenations* $\widehat{\mathcal{T}}_{\mathcal{C}}^{(t)k} \;\neq\; \widehat{\mathcal{T}}_{\mathcal{C}}^{(t)}$

Projections and Permutations

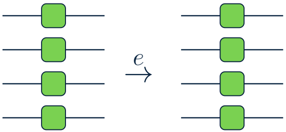
t-copies of Haar unitaries $\mathcal{U}(d)$ *project*, and cHaar channels $\mathcal{C}(d, d_{\mathcal{E}})$ *map* onto t-order permutations

$$\mathcal{S}_t = \{e\ ,\ \tau\ ,\ \sigma\ ,\ \dots\}$$

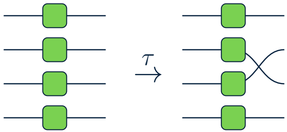
Projections and Permutations

t-copies of Haar unitaries $\mathcal{U}(d)$ *project*, and cHaar channels $\mathcal{C}(d, d_{\mathcal{E}})$ *map* onto t-order permutations

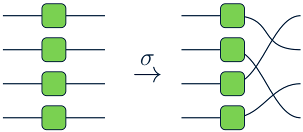
$$\mathcal{S}_t = \{e \ , \ \tau \ , \ \sigma \ , \ \dots\}$$



$e \cong I$

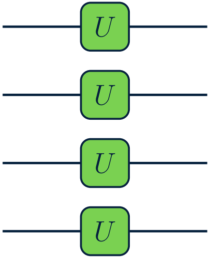


$\tau \cong \mathrm{SWAP}$

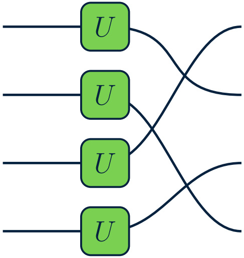


$\sigma \cong \mathrm{PERMUTE}$

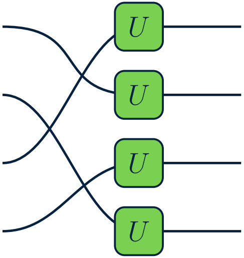
Projections and Permutations



$\xrightarrow{\sigma}$



$=$



$U^{\otimes 4}$

$\sigma = (1\ 2\ 4\ 3)$

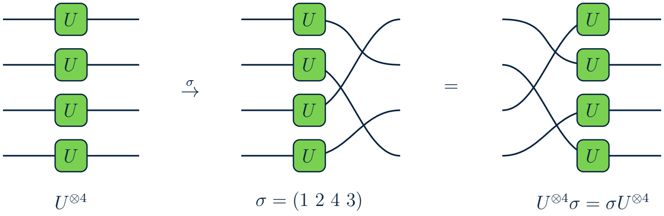
$U^{\otimes 4}\sigma = \sigma U^{\otimes 4}$

Projections and Permutations

- Haar unitaries *project*, and cHaar channels *map* onto permutations

$$\boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{U}(d)}} = \int_{\mathcal{U}(d)} dU \; U^{\otimes t} \otimes U^{\otimes t\;*} = \frac{1}{d^t} \sum_{\sigma,\pi \in \mathcal{S}_t} \tau^{(t)}_{\mathcal{U}(d)}(\sigma,\pi)\; |\sigma\rangle\!\rangle\langle\!\langle\pi| \tag{22}$$

$$\boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}} = \langle\!\langle I_{\mathcal{E}}^{\otimes t}|\; \widehat{\mathcal{T}}^{(t)}_{\mathcal{U}(dd_{\mathcal{E}})}\; |\nu_{\mathcal{E}}^{\otimes t}\rangle\!\rangle = \frac{1}{d^t} \sum_{\sigma,\pi \in \mathcal{S}_t} \tau^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}(\sigma,\pi)\; |\sigma\rangle\!\rangle\langle\!\langle\pi| \tag{23}$$



Projections and Permutations

- *Permutations* $\sigma, \pi \in \mathcal{S}_t$ are *non-orthogonal*,

$$\boxed{\langle\!\langle \sigma | \pi \rangle\!\rangle \propto 1/d^{|\sigma^{-1}\pi|}}\,, \tag{24}$$

which complicates analysis of moment operators and their *concatenations*

Projections and Permutations

- *Permutations* $\sigma, \pi \in \mathcal{S}_t$ are *non-orthogonal*,

$$\boxed{\langle\langle \sigma | \pi \rangle\rangle \propto 1/d^{|\sigma^{-1}\pi|}}\,, \tag{24}$$

which complicates analysis of moment operators and their *concatenations*

- *Localized permutations* $[\sigma], [\pi] \in [\mathcal{S}_t]$ are *block-diagonal with respect to support*,

$$\boxed{\langle\langle [\sigma] | [\pi] \rangle\rangle \propto \delta_{\mathrm{supp}(\sigma)=\mathrm{supp}(\pi)}}\,, \tag{25}$$

which reveals important similarities and differences between moment operators

Localized Permutation Basis

Permutations σ have *definite* support $\mathrm{supp}(\sigma) \subseteq [t]$ over a *subset* of t indices

$$\leftrightarrow$$

Suppose we expand permutations in t-copies of an orthogonal basis

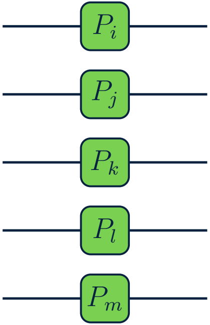
$$\mathcal{P}_d^{\otimes t} = \{P_1 \otimes P_2 \otimes \cdots \otimes P_t \quad : \quad P_1, P_2, \ldots, P_t \in \mathcal{P}_d\}$$

$$\leftrightarrow$$

Can we find a *basis* for permutations defined by their *support*?

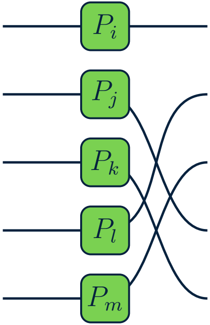
$$\sigma \quad \sim \quad \sum_{\substack{P \in \mathcal{P}_d^{\otimes t} \\ \mathrm{supp}(P) \subseteq \mathrm{supp}(\sigma)}} \mathrm{tr}(\sigma P) \;\; P$$

Localized Permutation Basis



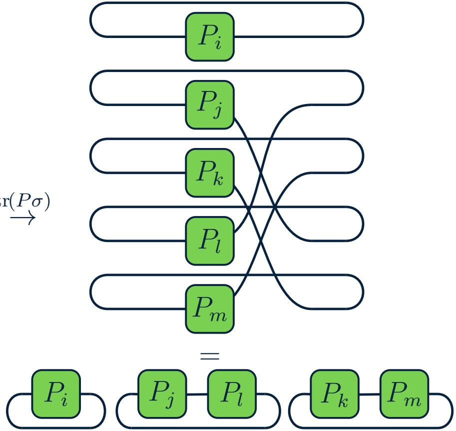
$$P = P_i \otimes P_j \otimes P_k \otimes P_l \otimes P_m$$

$\xrightarrow{\sigma}$



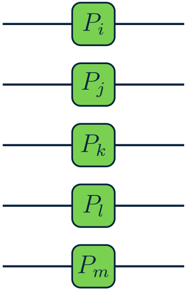
$$\sigma = (jl)(km)$$

$\xrightarrow{\mathrm{tr}(P\sigma)}$

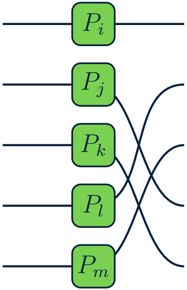


$$\mathrm{tr}(P\sigma) = \mathrm{tr}\left(\prod_{\mu\in\sigma} P_\mu\right)$$

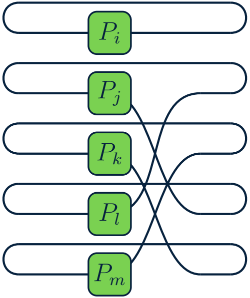
Localized Permutation Basis



$\xrightarrow{\sigma}$



$\xrightarrow{\mathrm{tr}(P\sigma)}$



$=$

$$P = P_i \otimes P_j \otimes P_k \otimes P_l \otimes P_m$$

$$\sigma = (jl)(km)$$

$$\mathrm{tr}(P\sigma) = \mathrm{tr}\left(\prod_{\mu\in\sigma} P_\mu\right)$$

$$\boxed{\tau = \frac{1}{d}\sum_{P\in\mathcal{P}_d} P \otimes P^\dagger} \quad \rightarrow \quad \boxed{\sigma = \prod_{\tau} \tau = \prod_{\tau=(ij)} \left[\frac{1}{d}\sum_{P\in\mathcal{P}_d} P_i \otimes P_j^\dagger\right]} \tag{26}$$

Localized Permutation Basis

By *grouping* products of tensor-product basis operators comprising permutations by their support, we may define *localized permutations*

$$[\mathcal{S}_t] = \{[\sigma] \quad : \quad \sigma \in \mathcal{S}_t \quad , \quad \langle[\sigma],[\pi]\rangle \propto \delta_{\mathrm{supp}(\sigma)=\mathrm{supp}(\pi)}\}$$

$$[\sigma] \quad \sim \sum_{\substack{P \in \mathcal{P}_d^{\otimes t} \\ \mathrm{supp}(P)=\mathrm{supp}(\sigma)}} P$$

Permutations σ may then be expanded in terms of localized permutations (corresponding to their *sub-permutations* $|\pi^{-1}\sigma| = |\sigma| - |\pi|$)

$$\sigma \quad = \quad \frac{1}{d^{|\sigma|}} \sum_{\pi \subseteq \sigma} [\pi] \tag{27}$$

Moment Operator Localized Permutation Transfer Matrices

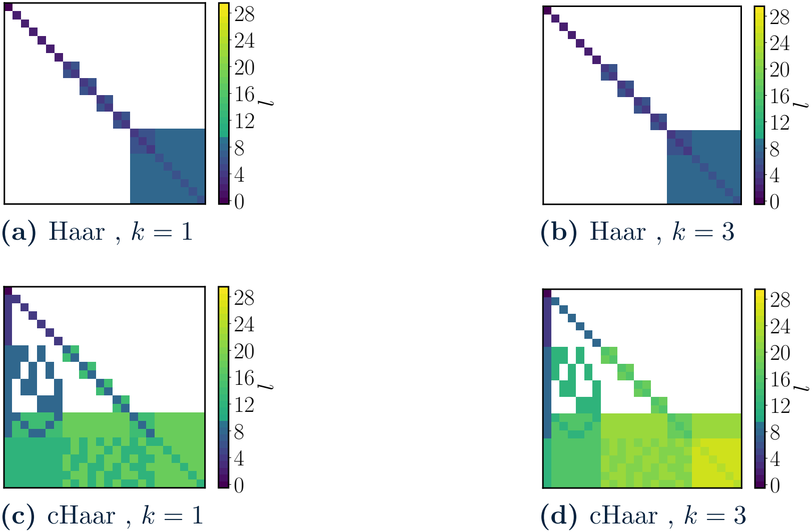


Figure 1: Transfer matrices for $t = 4$, k-concatenations, from the smallest identity (top-left), to the largest cycles (bottom-right), scaling as $\tau^{(t,k)}_{\mathcal{U},\mathcal{C}} \sim \mathcal{O}(1/d^l)$.

Hierarchy of Ensembles

The t-order Haar, cHaar, Depolarize ensembles are related by

$$\lim_{d_{\mathcal{E}}\to 1} \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}} \to \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{U}(d)}} \qquad \lim_{\frac{d}{d_{\mathcal{E}}}\to\infty} \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}} \to \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{D}(d)}} \tag{28}$$

Hierarchy of Ensembles

The t-order Haar, cHaar, Depolarize ensembles are related by

$$\lim_{d_{\mathcal{E}}\to 1} \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}} \to \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{U}(d)}} \qquad \lim_{\frac{d}{d_{\mathcal{E}}}\to\infty} \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{C}(d,d_{\mathcal{E}})}} \to \boxed{\widehat{\mathcal{T}}^{(t)}_{\mathcal{D}(d)}} \tag{28}$$

The k-concatenated, t-order cHaar ensemble is *depolarizing* and *non-unital* [3]

$$\lim_{\frac{d}{d_{\mathcal{E}}}\to\infty} \widehat{\mathcal{T}}^{(t)k}_{\mathcal{C}(d,d_{\mathcal{E}})} = \boxed{\underbrace{\widehat{\mathcal{D}}^{\otimes t}}_{\text{Depolarize}}} + \boxed{\underbrace{\mathcal{O}\left(\frac{1}{d^2 d_{\mathcal{E}}}\right) \widehat{\Delta}^{(t,k)}_{\mathcal{C}(d,d_{\mathcal{E}})}}_{\text{Non-Unital}}} \tag{29}$$

[3] Bai, J. *et al.*, *Quantum Information Processing* **23**, 1–18 (2024)

Hierarchy of Ensembles

The k-concatenated t-th cHaar moment operator has a single leading eigenvalue $\lambda = 1$, with other sub-leading eigenvalues of,

$$0 < |\lambda| \leq \mathcal{O}\left(\frac{1}{d_{\mathcal{E}}}\right) < 1 \; , \tag{30}$$

and in the fixed t and large $dd_{\mathcal{E}}$ limit, has norms and traces of,

$$\|\widehat{\mathcal{T}}^{(t)k}_{\mathcal{C}(d,d_{\mathcal{E}})}\|^2 \leq 1 \; + \; \mathcal{O}\left(\frac{1}{d_{\mathcal{E}}^2}\right) \tag{31}$$

$$\mathrm{tr}\left(\widehat{\mathcal{T}}^{(t)k}_{\mathcal{C}(d,d_{\mathcal{E}})}\right) \leq 1 \; + \; \mathcal{O}\left(\frac{1}{d_{\mathcal{E}}^k}\right) \; . \tag{32}$$

Hierarchy of Ensembles

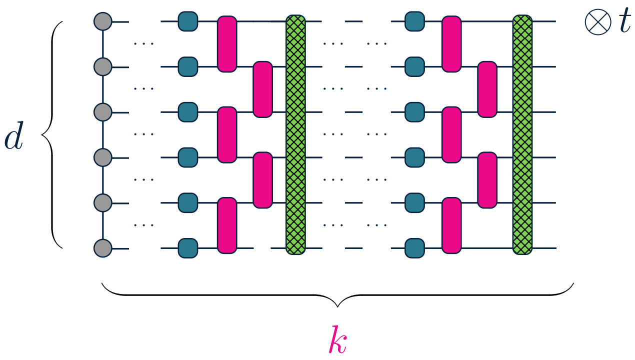
Given it holds analyticity in the fixed t and large $dd_{\mathcal{E}}$ limit, and numerically for $t \leq 4$, we *conjecture* the following hierarchy holds absolutely,

$$1 = \boxed{\left\|\widehat{\mathcal{T}}^{(t)}_{\mathcal{D}(d)}\right\|^2} \underset{dd_{\mathcal{E}}\to\infty}{\leq} \boxed{\left\|\widehat{\mathcal{T}}^{(t)k}_{\mathcal{C}(d,d_{\mathcal{E}})}\right\|^2} \underset{dd_{\mathcal{E}}\to d}{\leq} \boxed{\left\|\widehat{\mathcal{T}}^{(t)}_{\mathcal{U}(d)}\right\|^2} = t! \qquad (33)$$

Relationships between Noise and Channel t-designs

Analytical *moment operator norms* for k layers of specific channel *ansatze*

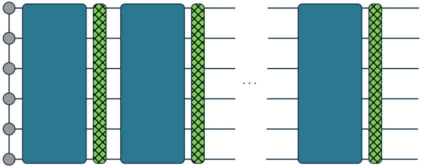
$$\Lambda^{k}_{\mathcal{U}_\gamma}(\rho) = (\mathcal{N}_\gamma \circ \mathcal{U})^k(\rho) = \frac{\mathrm{tr}(\rho)}{d} I + \Delta^{(k)}_\gamma(\rho) \tag{34}$$



Relationships between Noise and Channel t-designs

Haar Random Unitaries + Fixed *Unital* Pauli Noise: *Decreases* Norms

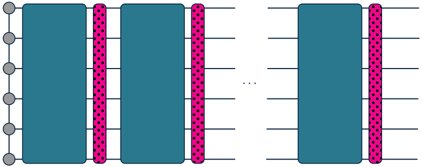
$$\|\widehat{\mathcal{T}}^{(t,k)}_{\mathcal{U}\gamma} - \widehat{\mathcal{T}}^{(t)}_{\mathcal{D}}\|^2 = \mathcal{O}\big((1-\gamma)^{2k}\big) \tag{35}$$



Relationships between Noise and Channel t-designs

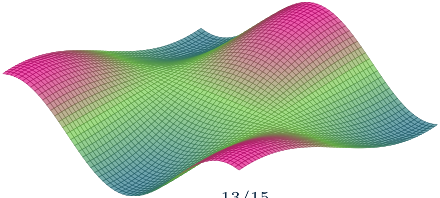
Haar Random Unitaries + Fixed *Non-Unital* Pauli Noise: *Increases* Norms

$$\|\widehat{\mathcal{T}}^{(t,k)}_{\mathcal{U}\gamma\eta} - \widehat{\mathcal{T}}^{(t)}_{\mathcal{D}}\|^2 = \mathcal{O}(\eta) \tag{36}$$



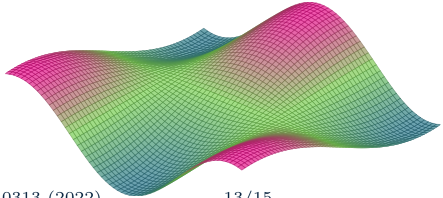
Designs versus Trainability

- Ensemble-dependent functions $\mathcal{F}$ may *concentrate* $\boxed{p\left(|\mathcal{F}-\mu_{\mathcal{F}}| \geq \epsilon\right) \leq \sigma_{\mathcal{F}}^2/\epsilon^2}$ (with *caveats* on ensembles, locality, norms, ...)



Designs versus Trainability

- Ensemble-dependent functions $\mathcal{F}$ may *concentrate* $\boxed{p\left(|\mathcal{F} - \mu_{\mathcal{F}}| \geq \epsilon\right) \leq \sigma_{\mathcal{F}}^2/\epsilon^2}$ (with *caveats* on ensembles, locality, norms, ...)
- *Objectives* and *gradients* $\boxed{\mathcal{L} = \mathrm{tr}(\Lambda(\rho)O) \to \partial\mathcal{L}}$ variances may decay [1]



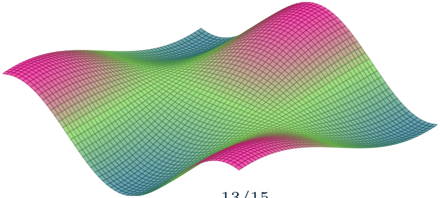
[1] Holmes, Z. *et al.*, *PRX Quantum* **3**, 010313 (2022)

Designs versus Trainability

- Ensemble-dependent functions $\mathcal{F}$ may *concentrate* $\boxed{p\left(|\mathcal{F}-\mu_{\mathcal{F}}| \geq \epsilon\right) \leq \sigma_{\mathcal{F}}^2/\epsilon^2}$ (with *caveats* on ensembles, locality, norms, ...)

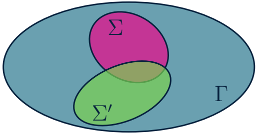
- *Objectives* and *gradients* $\boxed{\mathcal{L} = \mathrm{tr}(\Lambda(\rho)O) \to \partial\mathcal{L}}$ variances may decay

$$\sigma_{\mathcal{L}}^2\ ,\ \sigma_{\partial\mathcal{L}}^2 \quad \sim \quad \underbrace{\frac{\|\rho\|_2^2\ \|O\|_2^2}{\mathcal{O}(\mathrm{poly}(d, d_{\mathcal{E}}))}}_{\text{Inherent}} \quad + \quad \underbrace{\frac{\|\rho\|_p^2\ \|O\|_q^2}{\mathcal{O}(\mathrm{poly}(d, d_{\mathcal{E}}))}\ \|\mathcal{T}_{\Sigma}^{(2)} - \mathcal{T}_{\Sigma'}^{(2)}\|_p}_{\text{Designs}} \qquad (37)$$



Interpretations of Ensemble Statistics

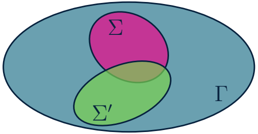
Many *subtle* differences between ensembles of channels and unitaries



Interpretations of Ensemble Statistics

Many *subtle* differences between ensembles of channels and unitaries

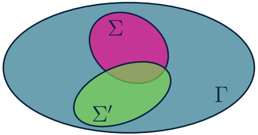
- Channel twirls are *contractive*, quasi-projections (defined via *dilation*)



Interpretations of Ensemble Statistics

Many *subtle* differences between ensembles of channels and unitaries

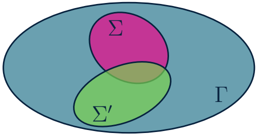
- Channel twirls are *contractive*, quasi-projections (defined via *dilation*)
- cHaar ensemble is a *uniform* set of channels (but with a *non-invariant* measure)



Interpretations of Ensemble Statistics

Many *subtle* differences between ensembles of channels and unitaries

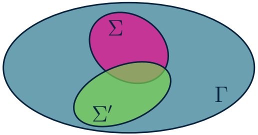
- Channel twirls are *contractive*, quasi-projections (defined via *dilation*)
- cHaar ensemble is a *uniform* set of channels (but with a *non-invariant* measure)
- Open systems have extra degrees of freedom (environment *size*, *coupling* strength)



Interpretations of Ensemble Statistics

Many *subtle* differences between ensembles of channels and unitaries

- Channel twirls are *contractive*, quasi-projections (defined via *dilation*)
- cHaar ensemble is a *uniform* set of channels (but with a *non-invariant* measure)
- Open systems have extra degrees of freedom (environment *size*, *coupling* strength)
- Adjoint channels are not necessarily *physical* channels (concentration *caveats*)



Interpretations of Ensemble Statistics

Many *subtle* differences between ensembles of channels and unitaries
